The JRC in Geel has released the certified reference material (CRM) ERM-AD623 for the calibration of quantitative real time polymerase chain reaction (qPCR) assays measuring the BCR-ABL1 transcript level in cDNA samples from leukaemia patients.

ERM-AD623 is a set of 6 solutions of a double stranded plasmid which is certified to contain a single copy of 3 specific DNA fragments:
- **BCR-ABL1** e14a2 transcript
- **BCR** transcript
- **GUSB** transcript

Each plasmid solution has a certified copy number concentration:

<table>

</tbody>
</table>

**Benefits of ERM-AD623**:
- Quantification of **BCR-ABL1** transcripts in relation to 3 control gene transcripts: **ABL1**, **BCR** and **GUSB**
- Suitable for several qPCR assays with different probe/primer sets or qPCR instruments.
- Evaluation of run-to-run variability and trends in results over time
- Improved comparability among results from different laboratories
- Standardised quantification of control gene transcripts for
  - Determination of the limit of detection of the reverse transcriptase qPCR method
  - Assignment of the level of deep molecular response in patients with undetectable **BCR-ABL1** transcript levels
  - Assessment of method performance of digital PCR assays

Details on ERM-AD623

Material
ERM-AD623 is a set of 6 vials containing solutions of a common plasmid at different copy number concentrations. The plasmid carries three specific DNA fragments, all present as a single copy: one from the fusion transcript \textit{BCR-ABL1 e14a2}, one from the native \textit{BCR} transcript and one from the \textit{GUSB} transcript. After linearization by restriction endonuclease digestion, the plasmid was diluted in an aqueous buffer containing 1 mmol/L Tris, 0.01 mmol/L EDTA and 50 ng/µL of transfer RNA from Escherichia coli. Each vial contains approximately 600 µL of plasmid solution.

Homogeneity and Stability
The homogeneity, short term and long term stability were demonstrated. Each of the six plasmid solutions was found to be homogeneous both within and between vials provided that the minimal sample intake of 2 µL is respected. The plasmid solutions can be safely stored for two years at -20 °C and transported on dry-ice. Under the condition that contaminations have been excluded, the solutions can be used for several experiments. The material should however not pass more than 10 freeze/thaw cycles. The material can also be stored at 4 °C for up to 4 weeks.

Characterisation
The six plasmid solutions of ERM-AD623 are certified for the number of specific DNA fragments per plasmid and the copy number concentration of the plasmid. The number of specific DNA fragments per plasmid is defined by the sequence of the plasmid as determined by dideoxy terminator sequencing of the entire plasmid. The certified values for the copy number concentration of the plasmid are based on the results from digital PCR measurements performed by three laboratories of demonstrated competence.

Intended use
ERM-AD623 is primarily intended for the calibration of qPCR methods measuring the number of \textit{BCR-ABL1 e14a2} transcripts in relation to the number of transcripts of one of three control genes: \textit{ABL1}, \textit{BCR} or \textit{GUSB}. The six plasmid solutions should be used to construct the calibration curves for both the \textit{BCR-ABL1} transcript and the control gene transcript of choice. The certified copy number concentrations refer to copy numbers of the double stranded plasmid and these values shall be multiplied by 2 when measuring single stranded cDNA samples from patients. In addition, the ERM-AD623 solutions can be used to assess method performance of digital PCR experiments quantifying the number of \textit{BCR-ABL1} transcripts. As any reference material, they can also be used for control charts or validation studies. Detailed instructions for use are given in a dedicated application note (see literature).

Suitability
The suitability of ERM-AD623 as a calibrator for qPCR methods quantifying the level of \textit{BCR-ABL1 e14a2} transcript in cDNA sample has been investigated by several expert laboratories. ERM-AD623 can be used to calibrate several qPCR assays using different probe/primer sets or PCR instruments. If ERM-AD623 is used for the quantification of the \textit{BCR-ABL1 e13a2} transcript, it should be verified that the \textit{BCR-ABL1 e13a2} transcript in the cDNA samples and the \textit{BCR-ABL1 e14a2} transcript in the ERM-AD623 solutions are amplified with equal efficiencies.
