Foreword

The Raw Materials Information System (RMIS), developed and hosted by the Joint Research Centre (JRC), is the EC’s reference knowledge platform on non-food, non-energy raw materials from primary to secondary sources. The RMIS includes a number of thematic sections, covering a broad range of topics relevant to raw materials policy. Among them, EU Country Profiles provide data and indicators for EU countries.

This report mirrors the content of the profile developed for Hungary, as available online in the RMIS.
Authors

Viorel Nita, Elisa Garbossa, Theodor Ciuta, Bianca Bonollo, Lucia Mancini, L., Beatriz Vidal-Legaz, Cynthia Latunussa, Dominic Wittmer, Tamas Hamor, Eleonora d’Elia, Manuela Unguru and Simone Manfredi
Abstract

The module European Country Profiles of the European Commission’s Raw Materials Information System (RMIS) provides country-specific data and indicators related to non-food, non-energy raw materials. These data and indicators are derived from data from official sources and well-established data providers, or by their elaboration. Each profile is structured into nine thematic sections: i) Key indicators; ii) Investment and regulatory framework; iii) research, development and innovation; iv) Resources and reserves; v) Supply; vi) Raw materials use; vii) Trade; viii) Environment; and ix) Social & Policy.

The current country report presents the data and indicators for Hungary, mirroring the EU Country Profile for Hungary included in the RMIS in March 2020, which is the reference month of the data used.
1 Introduction

The module European Country Profiles(1) of the European Commission’s Raw Materials Information System (RMIS) aims to provide country-specific knowledge for non-food, non-energy raw materials. Seventeen EU countries profiles are currently accessible in the RMIS. For the remaining EU countries, work is ongoing.

These country profiles synthetize key data, information and indicators related to raw materials by either using data from established data providers (e.g., Eurostat, IMF, World Bank, UNIDO, UN Statistics) or by JRC elaboration based on the available official data (e.g., data on country’s trade in raw materials at HS 6-digit level, country’s exports of mining equipment, etc.).

Each profile is structured into nine thematic sections, as presented hereafter.

Key Indicators (section 1) and Research, development and innovation (section 3) include both selected economy-wide indicators (e.g., industrial competitiveness, contribution of mining sector to national economies, industry and manufacturing value added as share of GDP) and data on the economic performance of industrial sectors particularly relevant for raw materials - e.g. value added, employment, labour productivity, as well as magnitude of research and development expenditure.

Indicators of country-level and sectorial investments (e.g., share of total investment in GDP, foreign direct investments and exploration budget in metals and mining), as well the specificities of countries’ mining legislative frameworks are presented in section 2, Investment and regulatory framework. Data relating to country’s estimated mineral resources and reserves are provided in section 4, Resources and reserves.

Supply section (section 5) presents data on country’s volume of imported goods, domestic extraction by broad category of materials, production value of selected mining and manufacturing sectors, and country’s production of non-food, non-energy minerals.

Section 6, Raw material use, focuses on utilization of raw materials, presenting data on country’s volume of goods exported and domestic consumption by broad category of materials.

Section 7, Trade, presents country indicators and data on trade in non-food, non-energy raw materials, by relevant material category, product cluster, and Harmonized System chapter and subheading. Based on the methodology developed within the framework of Raw Materials Scoreboard (2), this section also presents the country’s exports of mining equipment.

Environment section (section 8) includes tables and charts of selected indicators of environmental performance of relevant industrial sectors, such as emissions of greenhouse gases and particulate matter and generation of waste.

Several social and policy indicators are displayed in the section 9, Social & Policy, such as governance quality, policy perception, country risk and occupational safety.

The current country report presents data and indicators for Hungary, as elaborated in the EU Country Profiles module in the RMIS. This country profile was developed in March 2020, which is the reference month of most of the data (i.e., it includes the data available at that time).

Hungary has a competitive industry, ranking 26th in UNIDO’s Competitive Industrial Performance Index in 2017. Industry’s value added accounted for a quarter of GDP in 2018, and manufacturing’s for 19 percent.

Based on the share in the total manufacturing’s value added, an important raw material relevant manufacturing sector is chemicals and chemical products, with a share of 12% in manufacturing’s total value added in 2017.

From the selected raw material relevant sectors, manufacture of other non-metallic minerals and manufacture of basic metals were the most significant contributors to the total value added and employment of the whole industry in 2017.

(1) https://rmis.jrc.ec.europa.eu/?page=country-profiles/
(2) For more methodological details and the list of 21 six-digit HS codes covered by this indicator, Raw materials scoreboard 2018, Methodological notes, Mining equipment exports, https://op.europa.eu/en/publication-detail/-/publication/117c8d9b-e3d3-11e8-b690-01aa75ed71a1
Two industrial sectors, manufacture of paper and paper products and manufacture of rubber and plastic products had the highest level of business expenditure on R&D from the selected raw material relevant sectors in 2017.

Manufacture of basic metals, manufacture of other non-metallic minerals and manufacture of wood and wood products had high production value in 2018.

In 2017, Hungary’s production of perlite accounted for 1.5 percent of world’s production.

The total amount of non-metallic mineral materials used by the Hungarian economy in 2018 was more than 40 percent higher than their domestic consumption level in 2008.

In 2017, Hungary was a net importer of Intermediate goods (food- and energy-related commodities included), and had trade surplus for Raw Materials (food- and energy-related commodities included) and other two HS broad product groups - Capital goods and Consumer goods.

For the four raw materials relevant HS product clusters selected, Hungary was a net importer of Minerals and Metals, and had trade surplus for Stone and Glass and Wood in 2017.

At HS two-digit level, Hungary had significant trade surplus for Rubber (HS 40) and Wood and articles of wood (HS 44) in 2017. At HS six-digit level, primary aluminium accounted for almost 8% of country’s total import value of non-food, non-energy raw materials in the same year.

As far as the environmental performance of the raw material relevant industrial sectors is concerned, three industrial sectors - manufacture of other non-metallic minerals, manufacture of basic metals and mining and quarrying - had the highest greenhouse gas emission intensity in 2017; mining and quarrying had by far the highest PM 2.5 emission intensity.

Hungary has medium-level scores for all six dimensions of governance, according to the Worldwide Governance Indicators, and has a very low country risk, according to INFORM index.
2 Key indicators

2.1 Gross domestic product

**Definition:** GDP data are expenditure-based, in constant prices and billions of national currency units. Base year is country specific.

![Figure 1. Gross domestic product (constant prices; 2005)](image)

2.2 Competitive Industrial Performance Index

**Definition:** As calculated by UNIDO, Competitive Industrial Performance Index (CIP) aims at measuring the industrial performance of countries. CIP is a composite index based on eight indicators, grouped into three dimensions of industrial competitiveness: production and export capability; technology; and impact on global industrial production and trade.

The 2018 CIP report covers 150 economies (\(^4\)).

---

\(^1\) IMF, World Economic Outlook Databases, [https://www.imf.org/en/Publications/SPROLLs/world-economic-outlook-databases#sort=%40imfdate%20descending](https://www.imf.org/en/Publications/SPROLLs/world-economic-outlook-databases#sort=%40imfdate%20descending)

2.3 Mining Contribution Index

**Definition:** The Mining Contribution Index (MCI) quantifies the extent of mining sector’s contribution to a country’s economy. It is an index composed of four indicators, namely:

1. mineral and metal contribution to country’s exports in 2016
2. change in export contribution of mining and metal exports over the period 2011–2016
3. mineral production value in 2016, expressed as a percentage of GDP
4. mineral rents as percentage of GDP.

</tbody>
</table>

2.4 Industry’s and manufacturing's value added as share of GDP

**Definition:** Value added is the net output of a sector. As defined by World Bank, industry covers here the International Standard Industrial Classification (ISIC) divisions 10–45. Industry’s value added comprises value added in mining, manufacturing, construction, electricity, water, and gas.

Part of the industry, manufacturing covers the ISIC divisions 15–37.

2.6 Value added of selected industrial sectors

**Definition:** As calculated by Eurostat, "Value added at factor costs is the gross income from operating activities after adjusting for operating subsidies and indirect taxes; value adjustments (such as depreciation) are not subtracted" (9).

The figure includes data for the following NACE Rev.2 sectors relevant for industrial raw materials:

1. B07 Mining of metal ores
2. B08, Other mining and quarrying
3. B09.9 Support activities for other mining and quarrying
4. C16 Manufacture of wood and of products of wood and cork, except furniture; manufacture of articles of straw and plaiting materials
5. C17 Manufacture of paper and paper products

---

6. C22.1 Manufacture of rubber products
7. C23 Manufacture of other non-metallic mineral products
8. C24 Manufacture of basic metals
9. E38.3 Materials recovery

As complete time series for value added were not available, the forestry-related sectors are not covered.

The contribution (percentage) of each sector to the total value added of industry (NACE sections B-E) is also presented in the figure.

**Figure 4.** Value added of selected industrial sectors\(^{(10)}\) \(^{(11)}\)

![Graph showing value added of selected industrial sectors over time.]

**2.7 Number of employees in selected industrial sectors**

**Definition:** One of the indicators used for monitoring employment sectors is the *Number of employees*. This variable is defined by Eurostat as those persons who work for an employer and who have a contract of employment and receive compensation in the form of wages, salaries, fees, gratuities, piecework pay or remuneration in kind. A worker from an employment agency is considered to be an employee of that temporary employment agency and not of the unit (customer) in which they work.

The NACE Rev.2 sections used to collect data and calculate the sectoral percentage of employees in the total industry sectors are the following: B: Mining and quarrying; C: Manufacturing; D: Electricity, gas, steam and air conditioning supply; E: Water supply, sewerage, waste management and remediation activities.

\(^{(10)}\) Value added at factor cost in raw materials sectors over time. It also shows the contribution of these activities to the value added of the whole industrial sector (including: mining and quarrying; manufacturing; electricity, gas, steam and air conditioning supply; water supply, sewerage, waste management and remediation activities).

2.8 Labour productivity of industry

This indicator presents the labour productivity of the four NACE Rev.2 sections of industry (B, Mining and quarrying; C, Manufacturing; D, Electricity, gas, steam and air conditioning supply; E, Water supply; sewerage, waste management and remediation activities), calculated by Eurostat as gross value added per employee.

---

\(^{(12)}\) Number of employees in the raw materials sectors over time. It also shows the contribution of these activities to the total number of jobs in the industrial sector (including: mining and quarrying; manufacturing; electricity, gas, steam and air conditioning supply; water supply, sewerage, waste management and remediation activities).

\(^{(14)}\) Eurostat, Structural business statistics (sbs), Annual detailed enterprise statistics for industry (NACE Rev. 2, B-E), dataset code: sbs_na_ind_r2, Gross value added per employee
2.9 Production value of mining and quarrying as share in total industry

**Definition**: Production value measures “the amount produced based on sales and including changes in stocks and the resale of goods and services. It is calculated by Eurostat as turnover plus/minus the changes in stocks of finished products, work in progress and goods and services purchased for resale, minus the purchases of goods and services for resale, plus capitalized production, plus other operating income (excluding subsidies). Income and expenditure classified as financial or extraordinary in company accounts is excluded from production value”\(^{(15)}\).

Data provided in the chart for *Mining and quarrying sector* are calculated as share of total industry (i.e., sections B-E, NACE Rev.2).

![Figure 7. Production value of mining and quarrying as share in total industry (sections B-E, NACE Rev.2)](http://appsso.eurostat.ec.europa.eu/nui/show.do?dataset=sbs_na_ind_r2&lang=en)

3 Investments and regulatory framework

3.1 Total investment as percentage of GDP

This indicator is calculated by the International Monetary Fund as a “ratio of total investment (in current local currency) and GDP (in current local currency). Investment or gross capital formation is measured by the total value of the gross fixed capital formation and changes in inventories and acquisitions less disposals of valuables”\(^{(17)}\).

**Figure 8.** Total investment as percentage of GDP \(^{(18)}\)

3.2 Foreign direct investments: flows and stocks

As defined by UNCTAD in the *Methodological Note* accompanying the World Investment Report 2017\(^{(19)}\):

1. “flows of FDI comprise capital provided (either directly or through other related enterprises) by a foreign direct investor to an FDI enterprise, or capital received from an FDI enterprise by a foreign direct investor”,

2. “FDI stock is the value of the share of their capital and reserves (including retained profits) attributable to the parent enterprise, plus the net indebtedness of affiliates to the parent enterprise”.

---

3.4 Annual exploration budget in metals and mining

S&P Global Market Intelligence is the provider of these data on annual exploration budget in metals and mining, based on the data reported by companies and its own estimates. The nonferrous exploration budgets covered by S&P Global Market Intelligence include spending for gold, base metals, platinum group metals, diamonds, U3O8, silver, rare earths, potash/phosphate, and many other hard-rock metals, but exclude exploration budgets for iron ore, coal, aluminium, oil and gas, and many industrial minerals.

Figure 11. Annual exploration budget in metals and mining\(^{(23)}\)

3.5 Business environment

Doing Business aims at measuring business regulation in economies by examining five dimensions:

1. Starting a business,
2. Getting a location,
3. Accessing finance,
4. Dealing with day-to-day operations,
5. Operating in a secure business environment.

It contains 11 indicator sets: Starting a business; Labour market regulation; Dealing with construction permits; Getting electricity; Registering property; Getting credit; Protecting minority investors; Trading across borders;

3.6 Regulatory framework

The regulatory framework review is focusing on minerals ownership, major governing laws, permitting rules and competent authorities. This extract is based on the MINLEX report published by DG GROW.(26)

Legislation, ownership, and categories of minerals

In Hungary all minerals are the property of the state. The primary ruling legislation is the Mining Act of 1993. It defines areas “open” or “closed” for exploration.

Regulatory framework and permitting

Whether an area is “open” (exploration is permitted by the regional authorities) or “closed” (exploration permit can be obtained through a mineral concession contracted centrally) is determined by the Mining and Geological Authority (MBFSZ) in decrees. Since 2010 the country is “closed” for exploration and extraction of ore minerals, hydrocarbons, coal and geothermal energy. In 2015 regional mining authorities and several other authorities merged to form county “Government Offices” (20 in total including Budapest), and the first-instance permitting procedure is considered a “one-stop-shop”. For minerals not requiring a concession (i.e. for construction and industrial minerals) the Government Offices issue the permit. These incorporate mining, environment, nature conservation, soil protection, and cultural heritage aspects. Interested clients can lodge an appeal against almost all resolutions, in this case MBFSZ acts as the second-instance authority.

Concerning exploration, for aggregates and industrial minerals a simple vertical permitting scheme rules the procedure; for ores, a concession tendering procedure is in place prior to the permitting scheme. A concession is given for a maximum of 35 years and can be extended for another 17.5 years. The exploration period can have a duration of four years and may be extended for another two years (in exceptional cases for two more years). Prior to extraction the establishment of a mining plot and an approved Technical Operation Plan is needed, approved for 5 years in case of underground mining, and 15 years in the case of opencast. (27)

(24) http://www.doingbusiness.org/reports/global-reports/doing-business-2019
(27) DG GROW, Legal framework for mineral extraction and permitting procedures for exploration and exploitation in the EU, final report of MINLEX project, 2017. More detailed information on the legal and regulatory framework can be found at the Policy&Legislation/Member States Legislation section.
4 Research, development, and innovation

4.1 Gross domestic expenditure on R&D

**Definition:** Gross domestic expenditure on R&D (GERD) includes expenditure on research and development by business enterprises (BERD), higher education institutions, as well as government and private non-profit organizations. For additional methodological details, see Eurostat, Statistics on research and development (rd) (28).

![Figure 12. Gross domestic expenditure on R&D](image)

4.2 Business expenditure on R&D by relevant NACE Rev. 2 sector

**Definition:** Expenditure on R&D in the business enterprise sector (BERD) includes all business R&D carried out on national territory (30).

The figure includes data for the following NACE Rev. 2 sectors:

1. Mining and quarrying (B);
2. Manufacture of wood and of products of wood and cork, except furniture; manufacture of articles of straw and plaiting materials (C16);
3. Manufacture of paper and paper products (C17);
4. Manufacture of rubber and plastic products (C22);
5. Manufacture of other non-metallic mineral products (C23);
6. Manufacture of basic metals (C24);
7. Sewerage, waste management, remediation activities (incl. materials recovery) (E37-E39).

For additional methodological details, see Eurostat, Statistics on research and development (rd) (31).

---

Figure 13. Business expenditure on R&D by relevant NACE Rev. 2 sector \(^{(2)}\)

5 Resources and reserves

5.1 Estimated resources

**Definition:** The term is synonymously used for "mineral resource", "inferred mineral resource", "indicated mineral resource" and "measured mineral resource". In this case, confidence in the existence of a resource is indicated by the geological knowledge and preliminary data, while at the same time the extraction would be legally, economically, and technically feasible.

The Hungarian Office of Mining and Geology, regional Mining Inspectorates are responsible for collecting resource and reserve data. The data is collated in Budapest by the Hungarian Office of Mining and Geology, Division for Geology and Data Management. The data are collected annually via questionnaire. The resource and reserve figures do not include any marine or offshore mineral deposits nor any data from overseas territories. In addition, Hungary has sepiolite, attapulgite, diatomite, feldspar, phosphate rock but no resource data is available for these commodities.

### 5.2 Estimated reserves

**Definition**: The term is synonymously used for “mineral reserve”, “probable mineral reserve” and “proven mineral reserve”. In this case, confidence in the reserve is measured by the geological knowledge and data, while at the same time the extraction would be legally, economically, and technically feasible.

*No data was available for reserves in Hungary.*

6  Supply

6.1  Annual percentage change of the volume of imports of goods

As defined in the methodology of IMF’s World Economic Outlook, October 2018, Annual change of imports of goods refers to the aggregate change in the quantity of imports of goods. This indicator measures the percentage change in the volume estimates of imports of goods from the base year, which is country specific. According to the OECD’s definition, trade in goods includes “all goods which add to, or subtract from, the stock of material resources of a country by entering its economic territory (imports) or leaving it (exports)”. The goods commodity group aggregates commodity classes referring to the subheadings of the Harmonized System.

Figure 14. Annual percentage change of the volume of imports of goods (base year = 2005)

6.2  Domestic extraction by main category

Definition: Domestic extraction indicates the total amount of material extracted by resident units from the natural environment for further processing in the economy; the visualizations include three material categories (metals ores, non-metallic minerals, and woods).

The domestic extraction figure refers to the data provided by Eurostat Economy-wide material flow accounts (EW-MFA).

Table 6. Domestic extraction by main category (million tonnes)

6.3 Production value of selected manufacturing sectors

This section presents the gross output of selected raw materials related sectors in monetary terms (million Euro).

Sectoral data are taken from Eurostat, Structural Business Statistics. According to Eurostat’s methodology, Production value is an output-related variable that "measures the amount produced based on sales and including changes in stocks and the resale of goods and services. Production value is calculated by Eurostat as turnover plus/minus the changes in stocks of finished products, work in progress and goods and services purchased for resale, minus the purchases of goods and services for resale, plus capitalized production, plus other operating income (excluding subsidies)"\(^{(39)}\).

6.4 Production of primary minerals

**Definition:** Mineral Raw Materials are defined as mineral constituents of the earth’s crust, which are of economic value, including output from mines as well as the output from processing at or near the mines.

The Data related to mineral raw materials were obtained by WMD through evaluation of questionnaires sent to the National Committees of member countries of the World Mining Congress as well as to other bodies such as Embassies, Foreign Trade Representatives etc. In addition, WMD have also used, when available, official mining statistics such as BGS and USGS.

\(^{(41)}\) The mineral raw materials production refer to the data provided by The World Mining Data (WMD). The production data reported by WMD indicate the content of recoverable valuable elements and compounds.
7 Raw material use

7.1 Annual percentage change of the volume of exports of goods

As defined in the methodology of IMF’s World Economic Outlook, October 2017, Annual change of exports of goods refers to the aggregate change in the quantity of exports of goods. This indicator measures the percentage change in the volume estimates of exports of goods from the base year, which is country specific (42). According to the OECD’s definition, trade in goods includes “all goods which add to, or subtract from, the stock of material resources of a country by entering its economic territory (imports) or leaving it (exports)” (43). The goods commodity group aggregates commodity classes referring to the subheadings of the Harmonized System.

Figure 15. Annual percentage change of the volume of exports of goods (base year = 2005) (44)

7.2 Domestic material consumption by main category

Definition: Domestic material consumption (DMC), measures the total amount of materials directly used by an economy and is defined as the annual quantity of raw materials extracted from the domestic territory, plus all physical imports minus all physical exports.

Table 9. Domestic material consumption by main category (million tonnes) (45)

8 Trade

8.1 Import value index

**Definition:** Data are provided by World Bank, World Development Indicators, based on United Nations Conference on Trade and Development, Handbook of Statistics and data files, and International Monetary Fund, International Financial Statistics. For calculation of this index, import values are the current value of imports (f.o.b.) converted to U.S. dollars and expressed as a percentage of the average for the base period (year 2000).

![Figure 16. Import value index (2000 = 100)](image)

8.2 Export value index

**Definition:** Data are provided by World Bank, World Development Indicators, based on United Nations Conference on Trade and Development, Handbook of Statistics and data files, and International Monetary Fund, International Financial Statistics. For calculation of this index, export values are the current value of exports (f.o.b.) converted to U.S. dollars and expressed as a percentage of the average for the base period (year 2000).

![Figure 17. Export value index (2000 = 100)](image)

---

8.3 Raw materials’ physical trade balance by selected material category

**Definition:** Physical trade balance is calculated as imports minus exports, by material category.

8.4 Exports, imports and trade balance by HS Standard Product Group

The four HS Standard Product Groups provided by UNCTAD – i.e. *Raw Materials* (SoP1), *Intermediates* (SoP2), *Consumer Goods* (SoP3) and *Capital Goods* (SoP4) – are commodity aggregates that also include food and energy-related products\(^{(49)}\). They are available in the predefined product clusters of the Advanced Query tool of the World Integrated Trade Solutions database (WITS).

*Figure 18.* Exports, imports and trade balance by HS Standard Product Group in 2017 \(^{(50)}\)

8.5 Exports, imports, and trade balance by selected HS commodity group

The selected HS commodity groups are:

1. Metals (HS chapters 72–83),
2. Minerals (HS chapters 25 and 26),

\(^{(49)}\) WITS Reference Data, [https://wits.worldbank.org/referencedata.html](https://wits.worldbank.org/referencedata.html)

\(^{(50)}\) World Integrated Trade Solution (WITS), [https://wits.worldbank.org/](https://wits.worldbank.org/)
3. Stone and Glass (HS chapters 68-71)

These selected commodity groups contain non-food, non-energy raw material commodities. They are available in the predefined product clusters of the Advanced Query tool of the World Integrated Trade Solutions database (WITS).

**Figure 19.** Exports, imports and trade balance by selected HS commodity group in 2017 (51)

8.7 **Top 20 non-food, non-energy raw material commodities**

The Top 20 non-food, non-energy raw material commodities imported in 2017 and Top 20 non-food, non-energy raw material commodities exported in 2017 indicators present the country’s top 20 HS 6-digit non-food, non-energy raw materials imported/exported in 2017, based on the database built in the of Raw Materials Information System’s Economics & Trade module.\

*Figure 20.* Top 20 non-food, non-energy raw material commodities imported in 2017

---

Figure 21. Top 20 non-food, non-energy raw material commodities exported in 2017 (55)

8.8 Exports of mining equipment

This indicator was developed by JRC, based on data from UN Comtrade, accessed via World Bank’s World Integrated Trade Solution. The starting point for identifying the mining-equipment-related commodities were the products covered by the 4-digit NACE class 28.92, Manufacture of machinery for mining, quarrying and construction.

For more methodological details and the list of 21 six-digit HS codes covered by this indicator, see Raw materials scoreboard 2018, Methodological notes, Mining equipment exports.\(^{(56)}\)

9 Environment

9.1 Land used by mining sites and other activities

**Definition:** Mineral extraction sites (category 1.3.1): Areas with open-pit extraction of industrial minerals (sandpits, quarries) or other minerals (opencast mines). Includes flooded gravel pits, except for river-bed extraction. Urban areas refer to the sum of continuous urban fabric (land use category 1.1.1) and discontinuous urban fabric (land use category 1.1.2), which cover, respectively, land where buildings, roads and artificially surfaced area cover almost all the ground, and land where buildings, roads and artificially surfaced areas associated with vegetated areas and bare soil, which occupy discontinuous but significant surfaces. Agricultural areas are the sum of categories 2.1.1-2.4.4, which include arable land, rice fields, permanent crops, pastures, and heterogeneous agricultural areas. Forests cover broad-leaved forest (category 3.1.1), coniferous forest (category 3.1.2) and mixed forest (category 3.1.3). The percentage of the total area related to the official country area as reported by the Eurostat \(^{(58)}\). The net change refers to the area of each land use in 2012 minus the area in 2006, divided by area in 2006.

9.2 Greenhouse gas emissions and emissions intensity by raw materials sector

**Definition:** Greenhouse gas emissions refer to absolute emissions covering CO2, N2O and CH4, measured in CO2 equivalent). Emissions intensity presents intensity-ratios relating emissions to economic parameters, in this case gross value added, chain linked volumes (2010). Data are displayed for a selection of raw materials sectors (following the NACE Rev.2 classification). For absolute emissions, data are presented also for the sum of all economic activities. For emission intensity, average emission intensity for all NACE activities is also displayed. Concepts and principles are the same as in national accounts.

\(^{(59)}\) https://europa.eu/european-union/about-eu/countries/member-countries/

9.3 PM$_{2.5}$ emissions and emissions intensity by raw materials sector

**Definition:** Particulate matter is a complex mixture of microscopic solid or liquid matter in the air, and a key pollutant affecting human health. PM$_{2.5}$ emissions refer to absolute emissions of PM$_{2.5}$, which refers to the fraction of particulate matter with a size up to 2.5µm, which are responsible for damages to human health given their higher potential to enter much deeper in the respiratory system. PM$_{2.5}$ emissions intensity presents intensity-ratios relating emissions to economic parameters, in this case gross value added, in chain linked volumes (2010). Data are displayed for a selection of raw materials sectors (following the NACE Rev.2 classification). For absolute emissions, data are presented also for the sum of all economic activities. For emission intensity, average emission intensity for all NACE activities is also displayed. Concepts and principles are the same as in national accounts.

*Figure 25. Absolute PM$_{2.5}$ emissions* (62)

(62) Eurostat, Air emissions accounts by NACE Rev. 2 activity, code: env_ac_ainah_r2
9.4 Generation of waste by raw materials sector

**Definition**: Generation of waste by economic sector following the NACE Rev.2 classification as reported by Member States. Waste is considered as any substance or object that the holder discards or intends or is required to discard. The sludges (including the dredging spoils) are measured in dry matter. These data include all typologies of hazardous and non-hazardous waste.

---

**Figure 26.** PM$_{2.5}$ emissions intensity (emissions per gross value added) ($^{(5)}$)

9.5 Waste of Electrical and Electronic Equipment (WEEE) management

Eurostat reports statistics of on WEEE collected (total and from households) based on data reported by Member States. Statistics also include the amounts of total WEEE ‘recycled and prepared for re-use’, and the detail of WEEE prepared for re-use. Target on WEEE collection from households: the Directive 2012/19/EU on WEEE established (article 7) that, from 2016, the minimum collection rate in a given year in a Member State shall be 45 % of the EEE placed on the market, expressed as a percentage of the average weight of EEE placed on the market in the three preceding years in that Member State.

10 Social & Policy

10.1 Worldwide Governance Indicators

**Definition:** The Worldwide Governance Indicators cover over 200 countries and territories, measuring six dimensions of governance: Voice and Accountability, Political Stability and Absence of Violence/Terrorism, Government Effectiveness, Regulatory Quality, Rule of Law, and Control of Corruption. The aggregate indicators are based on several hundred individual underlying variables, taken from a wide variety of existing data sources. The data reflect the views on governance of survey respondents and public, private, and NGO sector experts worldwide. The WGI also explicitly report margins of error accompanying each country estimate. These reflect the inherent difficulties in measuring governance using any kind of data. Even after taking these margins of error into account, the WGI permit meaningful cross-country and over-time comparisons.\(^{(67)}\)

**Table 13. Worldwide Governance Indicators (2018)**\(^{(68)}\)

10.2 Policy Perception Index

**Definition:** The Policy Perception Index assesses the public regulatory framework that affects investment, i.e. how government policy affects attitudes towards exploration investment in each mining jurisdiction, ranking jurisdictions based on the responses to the Annual Survey of Mining Companies done by the Fraser Institute.

It measures the overall policy attractiveness of 91 jurisdictions through annual survey of mining and exploration companies.\(^{(69)}\)

Hungary: n.a.

### 10.3 Country risk: INFORM index

**Definition:** INFORM is a global, open-source risk assessment for humanitarian crises and disasters. It is developed by JRC and can support decisions about prevention, preparedness, and response. It builds up a picture of risk by bringing together around 50 different indicators that measure three dimensions of risk:

1. Hazard and exposure (events that could occur and the people or assets potentially affected by them);
2. Vulnerability (the susceptibility of communities to those hazards);
3. Lack of capacity (lack of resources available that can help absorb the shock).

**Table 14. Country risk: INFORM index (2019)**

<table>
<thead>
<tr>
<th>Components</th>
<th>Score*</th>
<th>Risk class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hazard and exposure</td>
<td>2.0</td>

</tr>
</tbody>
</table>

* a lower value (closer to 0) represents a lower risk and a higher value (closer to 10) represents a higher risk.

### 10.4 Occupational safety: rate of fatal accidents at work

**Definition:** The incidence rates express the number of accidents at work in relation to the number of persons employed, in economic activities related to raw materials sectors.

**Figure 30.** Occupational safety: rate of fatal accidents at work (incidents per 100k employees; 2017)

GETTING IN TOUCH WITH THE EU

In person

All over the European Union there are hundreds of Europe Direct information centres. You can find the address of the centre nearest you at: https://europa.eu/european-union/contact_en

On the phone or by email

Europe Direct is a service that answers your questions about the European Union. You can contact this service:
- by freephone: 00 800 6 7 8 9 10 11 (certain operators may charge for these calls),
- at the following standard number: +32 2299696, or
- by electronic mail via: https://europa.eu/european-union/contact_en

FINDING INFORMATION ABOUT THE EU

Online

Information about the European Union in all the official languages of the EU is available on the Europa website at https://europa.eu/european-union/index_en

EU publications

You can download or order free and priced EU publications from EU Bookshop at: https://publications.europa.eu/en/publications. Multiple copies of free publications may be obtained by contacting Europe Direct or your local information centre (see https://europa.eu/european-union/contact_en).
The European Commission's science and knowledge service
Joint Research Centre

JRC Mission
As the science and knowledge service of the European Commission, the Joint Research Centre’s mission is to support EU policies with independent evidence throughout the whole policy cycle.
